Computer Applications

# Database and its Applications

## Relational Algebra – Introduction

- ▶ Relational Algebra is a **procedural query language** for relational databases.
- ▶ Characteristics:
  - Operates on relations (sets of tuples).
  - Each operation produces a new relation (closure property).
  - Provides the theoretical foundation for SQL.
- ▶ We explore four key operations:
  - Select ( $\sigma$ )
  - Project ( $\pi$ )
  - Union ( $\cup$ )
  - Intersection ( $\cap$ )

# Database and its Applications

## Cartoon Dataset – Example

- ▶ Relation: CartoonCharacter(id, name, show, species, catchphrase)
- ▶ Sample Data:
  - ▶ (1, Mickey, Mickey Mouse Clubhouse, Mouse, "Oh boy!")
  - ▶ (2, Bugs, Looney Tunes, Rabbit, "What's up Doc?")
  - ▶ (3, Tom, Tom & Jerry, Cat, "Meow")
  - ▶ (4, Jerry, Tom & Jerry, Mouse, "Squeak")
  - ▶ (5, Homer, Simpsons, Human, "D'oh!")

# Database and its Applications

## Select Operation ( $\sigma$ ) – Definition

- ▶ The **Select** operation filters rows that satisfy a condition.
- ▶ Notation:

$$\sigma_{\theta}(R)$$

where  $\theta$  is a logical predicate.

- ▶ Properties:
  - Output schema = schema of  $R$ .
  - Returns only those tuples satisfying condition.

# Database and its Applications

## Select Operation ( $\sigma$ ) – Example

- ▶ Query: Find all cartoon characters who are Mice.
- ▶ Expression:

$$\sigma_{species='Mouse'}(CartoonCharacter)$$

- ▶ Input:  $\{(1, \text{Mickey, Mouse}), (2, \text{Bugs, Rabbit}), (4, \text{Jerry, Mouse})\}$
- ▶ Output:  $\{(1, \text{Mickey, ...}), (4, \text{Jerry, ...})\}$
- ▶ SQL Equivalent: `SELECT * FROM CartoonCharacter WHERE species = 'Mouse';`

# Database and its Applications

## Project Operation ( $\pi$ ) – Definition

- ▶ The **Project** operation selects specific attributes (columns).
- ▶ Notation:

$$\pi_{A_1, A_2, \dots, A_n}(R)$$

- ▶ Properties:
  - Eliminates duplicates.
  - Reduces schema to selected attributes.

# Database and its Applications

## Project Operation ( $\pi$ ) – Example

- ▶ Query: List the shows of cartoon characters.
- ▶ Expression:

$$\pi_{show}(CartoonCharacter)$$

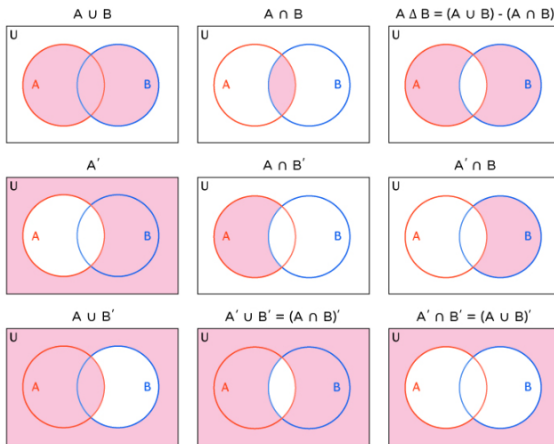

- ▶ Input: {(Mickey Mouse Clubhouse), (Looney Tunes), (Tom & Jerry), (Simpsons)}
- ▶ Output: {Mickey Mouse Clubhouse, Looney Tunes, Tom & Jerry, Simpsons}
- ▶ SQL Equivalent: `SELECT DISTINCT show FROM CartoonCharacter;`

# Database and its Applications

## Venn Diagram Representation

**Figure:** Representation of Common Set Operations (Union, Intersection, Difference, Complement, and Symmetric Difference)

# Database and its Applications

## Union Operation ( $\cup$ ) - Definition

- ▶ The **Union** operation returns tuples in either relation.
- ▶ Notation:

$$R \cup S$$

- ▶ Requirements:
  - Same number of attributes.
  - Same domains for corresponding attributes.
- ▶ Properties:
  - Duplicate tuples removed.
  - Commutative:  $R \cup S = S \cup R$ .

# Database and its Applications

## Union Operation ( $\cup$ ) - Example

- ▶ Relations:
  - ▶  $\text{DisneyCharacters}(\text{id}, \text{name}) = \{(1, \text{Mickey}), (6, \text{Goofy})\}$
  - ▶  $\text{LooneyCharacters}(\text{id}, \text{name}) = \{(2, \text{Bugs}), (7, \text{Daffy})\}$
- ▶ Query: Find all cartoon characters from Disney or Looney Tunes.
- ▶ Expression:

$\text{DisneyCharacters} \cup \text{LooneyCharacters}$

- ▶ Output:  $\{(1, \text{Mickey}), (6, \text{Goofy}), (2, \text{Bugs}), (7, \text{Daffy})\}$
- ▶ SQL Equivalent: 

```
SELECT id, name FROM DisneyCharacters
UNION
SELECT id, name FROM LooneyCharacters;
```

- ▶ The **Intersection** operation returns tuples common to both relations.
- ▶ Notation:  
$$R \cap S$$
- ▶ Requirements:
  - Relations must be union-compatible.

## Intersection Operation ( $\cap$ ) - Example

- ▶ Relations:
  - ▶  $\text{CharactersWithCatchphrases}(\text{name}) = \{\text{Mickey, Bugs, Homer}\}$
  - ▶  $\text{CharactersWithShows}(\text{name}) = \{\text{Mickey, Bugs, Tom, Jerry}\}$
- ▶ Query: Find cartoon characters with both a catchphrase and a show.
- ▶ Expression:

$\text{CharactersWithCatchphrases} \cap \text{CharactersWithShows}$

- ▶ Output:  $\{\text{Mickey, Bugs}\}$
- ▶ SQL Equivalent: 

```
SELECT name FROM
CharactersWithCatchphrases
INTERSECT
SELECT name FROM CharactersWithShows;
```

# Database and its Applications

## Problem Solving – Practice

- ▶ Q1: Find all Rabbits from the cartoon dataset.

$$\sigma_{species='Rabbit'}(CartoonCharacter)$$

- ▶ Q2: List all distinct catchphrases.

$$\pi_{catchphrase}(CartoonCharacter)$$

- ▶ Q3: Find all characters in either Disney or Looney Tunes.

$$DisneyCharacters \cup LooneyCharacters$$

- ▶ Q4: Find all characters with both a catchphrase and a show.

$$CharactersWithCatchphrases \cap CharactersWithShows$$

- ▶ Select ( $\sigma$ ): Filters rows by condition (e.g., all Mice).
- ▶ Project ( $\pi$ ): Extracts attributes (e.g., list of shows).
- ▶ Union ( $\cup$ ): Tuples in either relation (e.g., Disney  $\cup$  Looney).
- ▶ Intersection ( $\cap$ ): Tuples common to both (e.g., characters with shows and catchphrases).
- ▶ All results are relations  $\rightarrow$  enabling composition of operations.
