components	C	C	P	P	C	P
availability						

I. Agile :-

because of a unclear requirement, complex system, short time and cost limitation then to agile model some best

2) Evolutionary Prototype model:-

→ because of user requirements was unclear and client need a simple model and based on feedback that why once a client was get satisfied then more and developed

3) Incremental process model:-

I will use the incremental process model because the product is in a competitive, growing market where

→ early delivery of a core product and stepwise addition of feature give business advantage and supports changing requirements

4) V-Shape model:-

because of clear requirement and verification and validation give very and even start a need a testing base of a high-accuracy product

5) Evolutionary prototype

because of user requirements were not full clear may be that was change and small prototype and cost-effective in this user feedback is very important and feature and other requirement come to we can change using prototype model

case - 6

ingie - methodology

=) because how is adapting to the evolving needs of healthcare and addressing to that ~~the~~ modern technology using trends in patient that why

case study - 7

spiral model

reasons:-

a spiral model because of in a project was already well made and make a change upon to the rules a test rules were ^{some} forcibly change then all the processing go to first and may perfect

Case Study - 8

Prototyping model

→ the user was non-technical and requirement was unclear. That why to choices prototype model to make a visual simple that users and stick holder understand and give a feedback

case study - 9

V-model

→ because of V-model a engineer flight control model in was very hard product and verification and validation was most accuracy and every step you need a testing to at last not get any problem

case study - 10

V-model -

→ because of V-model in an oil company have a many department and that to need a verification and validation in all oil process was very accurate that in every stage we need a functionality was perfect our way to need testing
