OBJECT ORIENTED SOFTWARE ENGINEERING

Architectural Design

Archana A

Department of Computer Applications

- The software architecture of a computing system is the **structure(s) of the system** which comprise
 - The software components,
 - The externally **visible** properties of those components,
 - The relationships among the components.
- **Software architectural design** represents the **structure of the data** and **program components** that are required to build a computer-based system

- System organization Reflects the basic strategy that is used to structure a system.
- **Three organizational styles** are widely used:
 1. A **shared data repository** style;
 2. A **shared services and servers (Client-Server)** Style;
 3. An **abstract machine or layered style**

- Sub-systems must exchange data.
- This may be done in **two ways**:
 1. **Shared data** is held in a **central database or repository** and may be **accessed by all sub systems**;
 2. Each sub-system maintains its own database and **passes data explicitly to other sub systems**.
- When large amounts of data are to be shared, the repository model of sharing is most commonly used.
